

Question 1: This is a two-part question. (2 min max for both a & b combined)

- a) What do you know about our organization, and why are you interested in joining us for your co-op experience?
- b) How do you see yourself contributing to our team and goals during your co-op term?

Hello, I'm a passionate gamer and long-time fan of HoYoverse games like *Genshin Impact* and *Honkai: Star Rail*. I admire your dedication to building immersive worlds and global communities. I recently read that HoYoverse is investing more in AI strategy, which really excites me. When I saw the AI Product Manager co-op posting, I knew it was the perfect match for my skills and interests. I want to be part of your mission to use cutting-edge technology to improve game operations and player experiences.

In my past job, I led a process automation project. One of my solutions helped reduce over 50,000 working minutes per year and doubled the productivity of our engineering team. I'm confident I can bring the same mindset to HoYoverse—designing AI-powered tools, improving internal workflows, and helping your teams scale operations more efficiently. I would love to support your AI-driven business platform projects and bring real value during my co-op.

Question 2: This is a two-part question. (2 min max for both a & b combined)

- a) Describe a project you worked on during your postgraduate program. What was your role, and what was the outcome?
- b) How did you approach problem-solving in a team setting, particularly in the context of this project?

In my postgraduate program, I worked as a Product Manager for a group project where we built a bank agent chatbot. I led a team of seven people. We used Model Context Protocol (MCP), Retrieval-Augmented Generation (RAG), and large language models to power the chatbot. I was responsible for the overall product design, planning the roadmap, and coordinating between technical and non-technical team members. In the end, we received almost a perfect score for the project, and our chatbot successfully handled both FAQs and custom banking tasks.

At the beginning, most of the team didn't fully understand the advanced technologies like RAG and MCP because these topics were not yet covered in the course. So I took the lead to guide the team. I used a "low-tech, high-touch" approach, drawing diagrams on a whiteboard, breaking down technical parts into simple concepts, and assigning clear roles and tasks. This helped everyone stay aligned and move forward confidently. Regular meetings and open communication made it possible for us to solve problems quickly and meet our deadlines.
