

- 1- Train your model (criteria for training was already presented to you)
- 2- Save your model(weights and bias)
- 3- Use your trained model as backend( use it for inference/prediction/classification)
- 4- Design user interface(UI), that it takes the information of user ( $x_{test}$ ) and print the output in frontend.
- 5- Show the accuracy or any other criteria that user understand how much your model is precise (or could rely on)
